

ABSTRACT OF THE DISCLOSURE

A mobile communication controlling apparatus for
controlling inter-frequency handover includes a required
5 quality identifying unit configured to identify a quality
required for data addressed to a mobile station, a
transmission rate control unit configured to control a data
transmission rate of a higher layer based on the
identification result supplied from the required quality
10 identifying unit, and an inter-frequency handover
instruction unit configured to temporarily suspend signal
transmission from a radio base station connected to the
mobile communication controlling apparatus and allow the
mobile station to perform inter-frequency measurement.
